

segregation  
and educational opportunity  
new evidence from population data

october, 2017

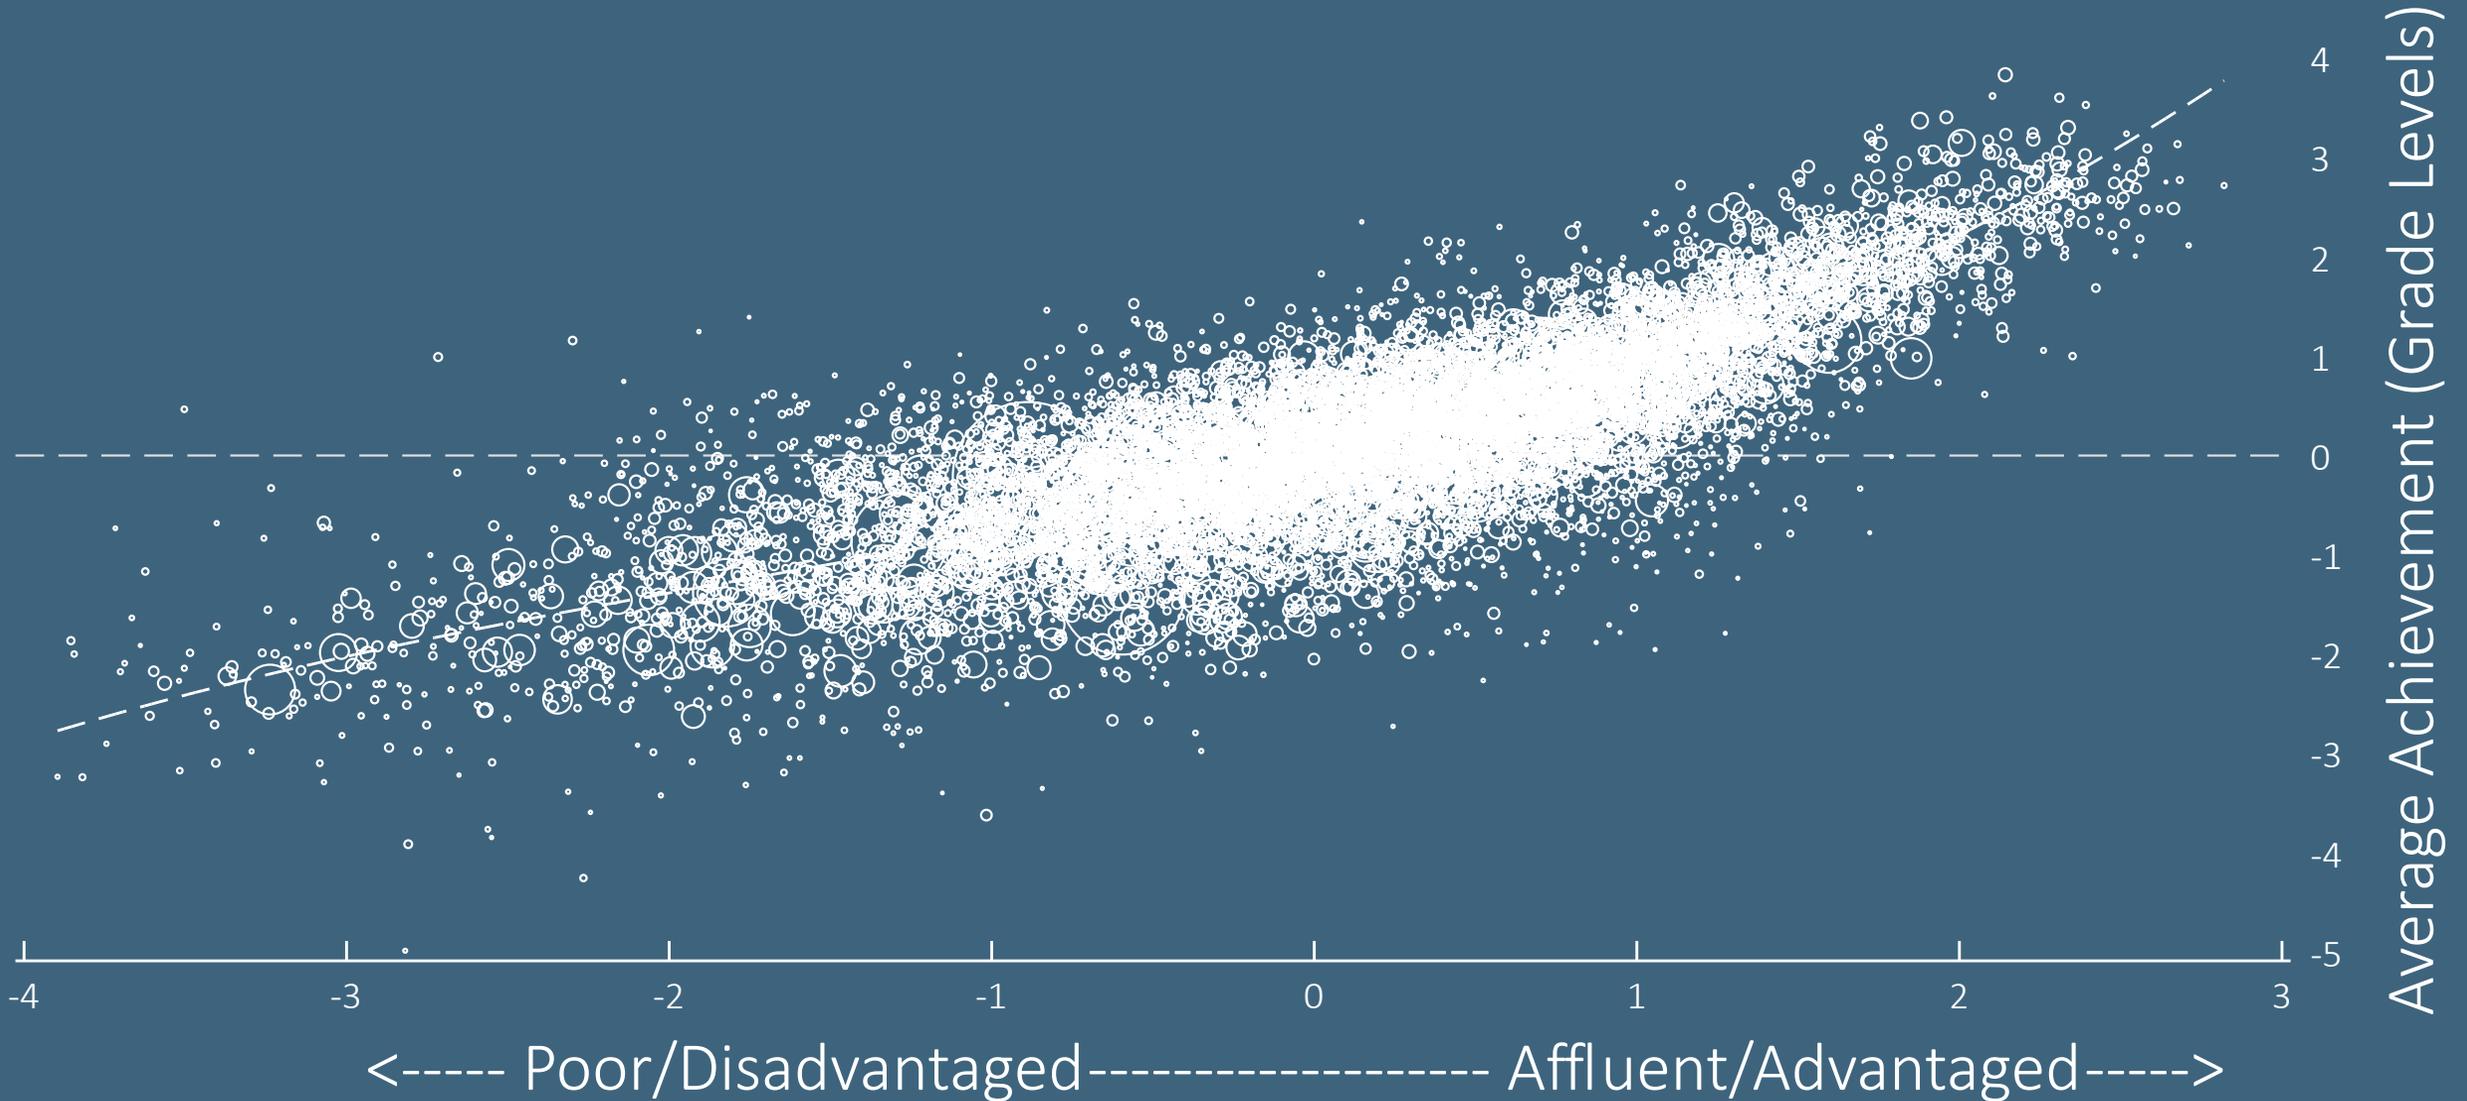

# Data (<http://seda.stanford.edu>)

- Average district-level standardized test scores (on state accountability tests)
  - 11,280 geographic school districts (including local charter schools) and 384 metropolitan areas
  - Grades 3-8
  - Math & ELA (today I'm reporting average of Math and ELA)
  - 2009-2015 (10 cohorts of students entering K in 2000 – 2011)
  - By race/ethnicity and economic disadvantage
  - Based on ~300,000,000 test scores
  - Scores are placed on common scale across states, years, and grades
- Demographic data
  - Family characteristics (of families with children in public schools)
  - From American Community Survey (ACS)

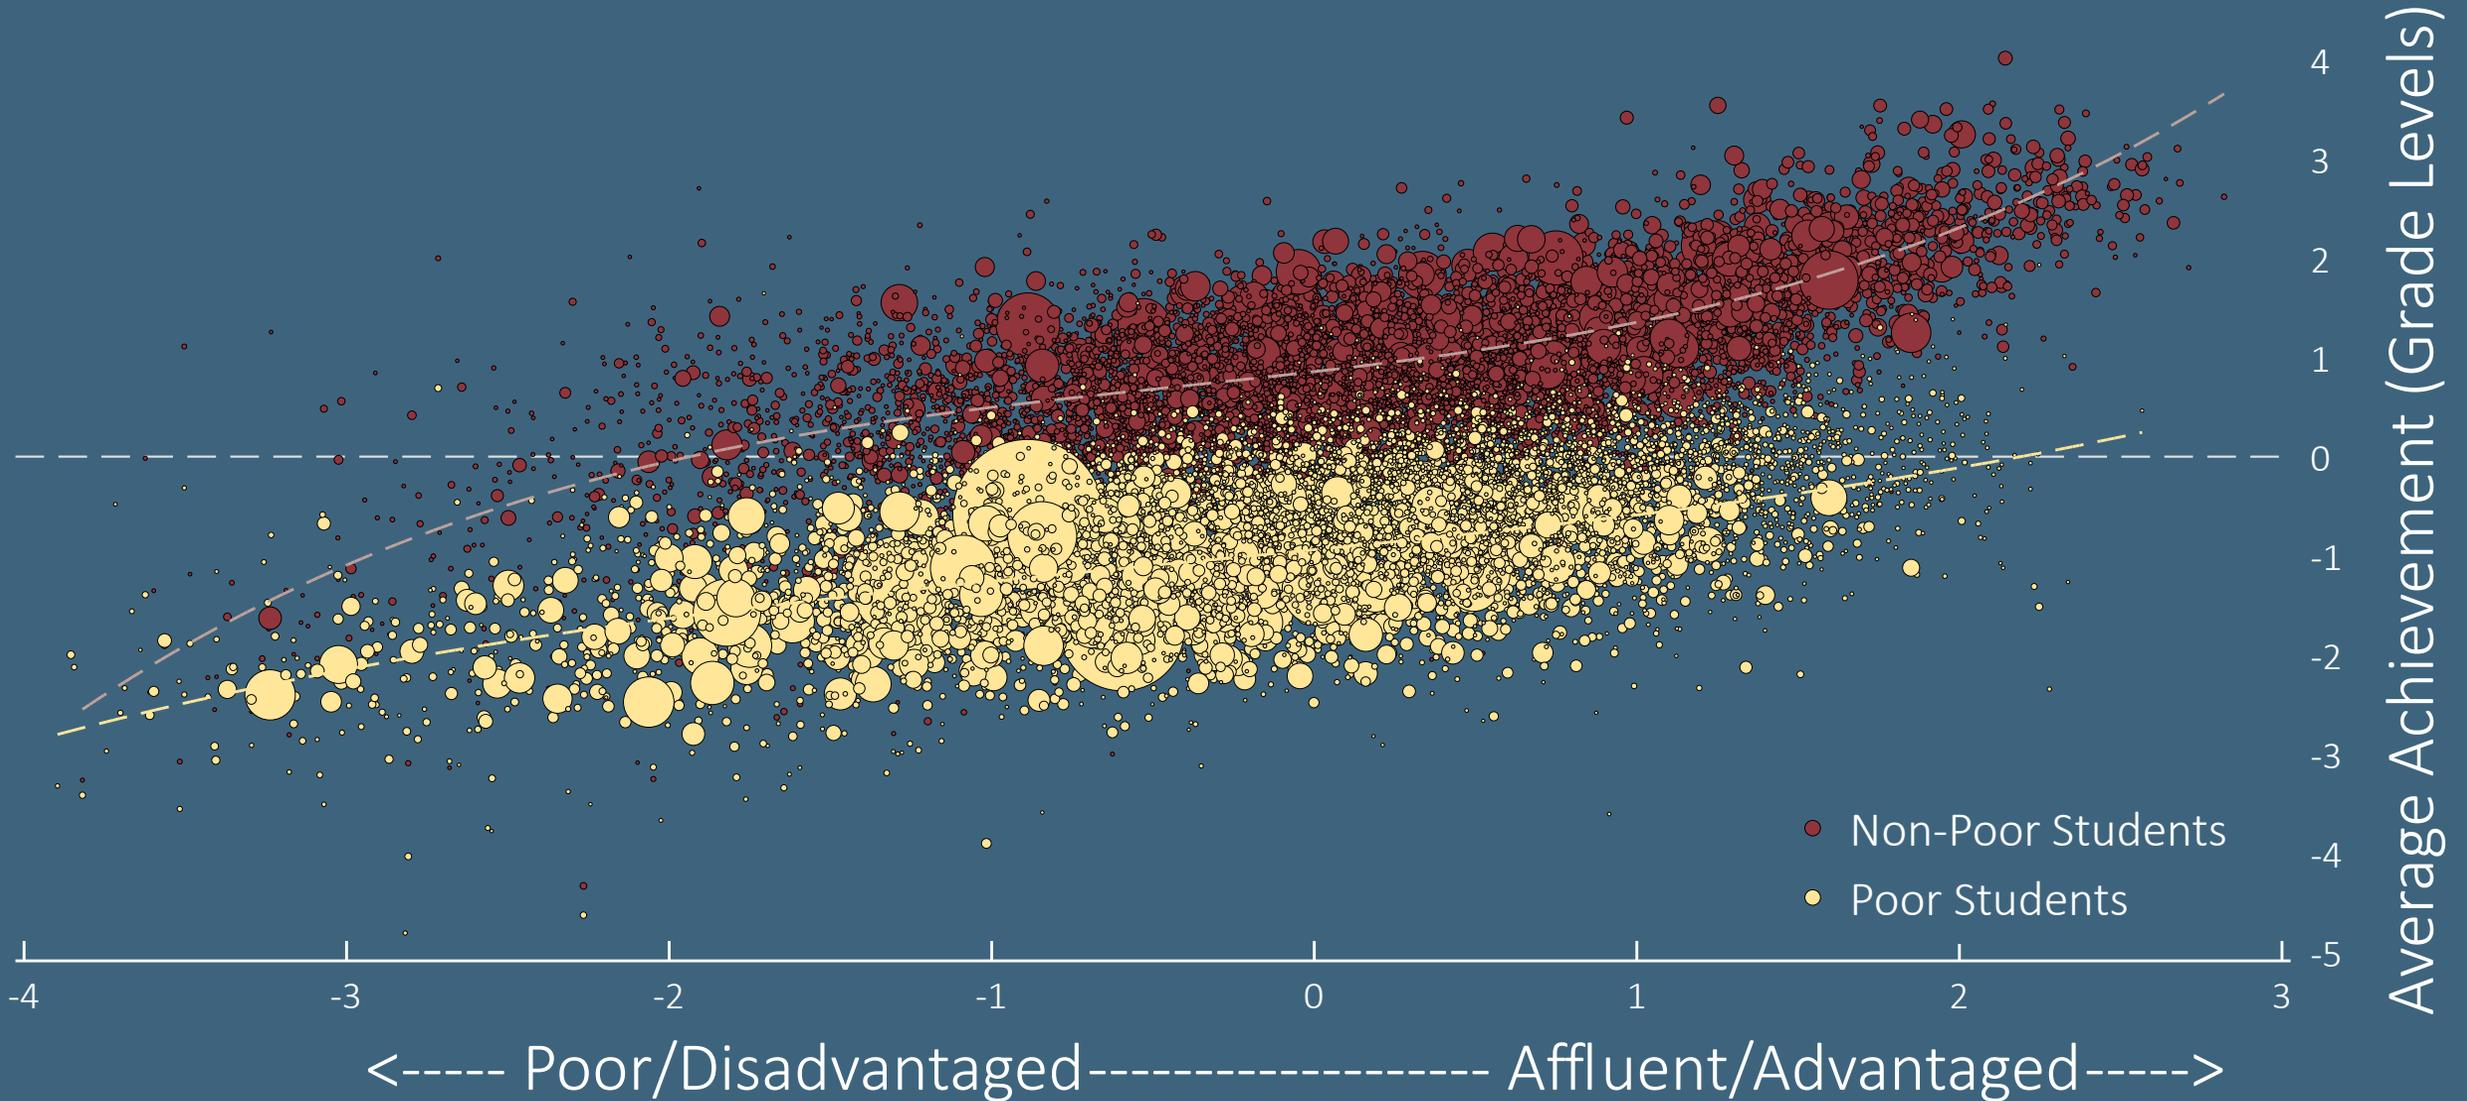

# Academic Achievement and Socioeconomic Status

US School Districts, 2009-2015

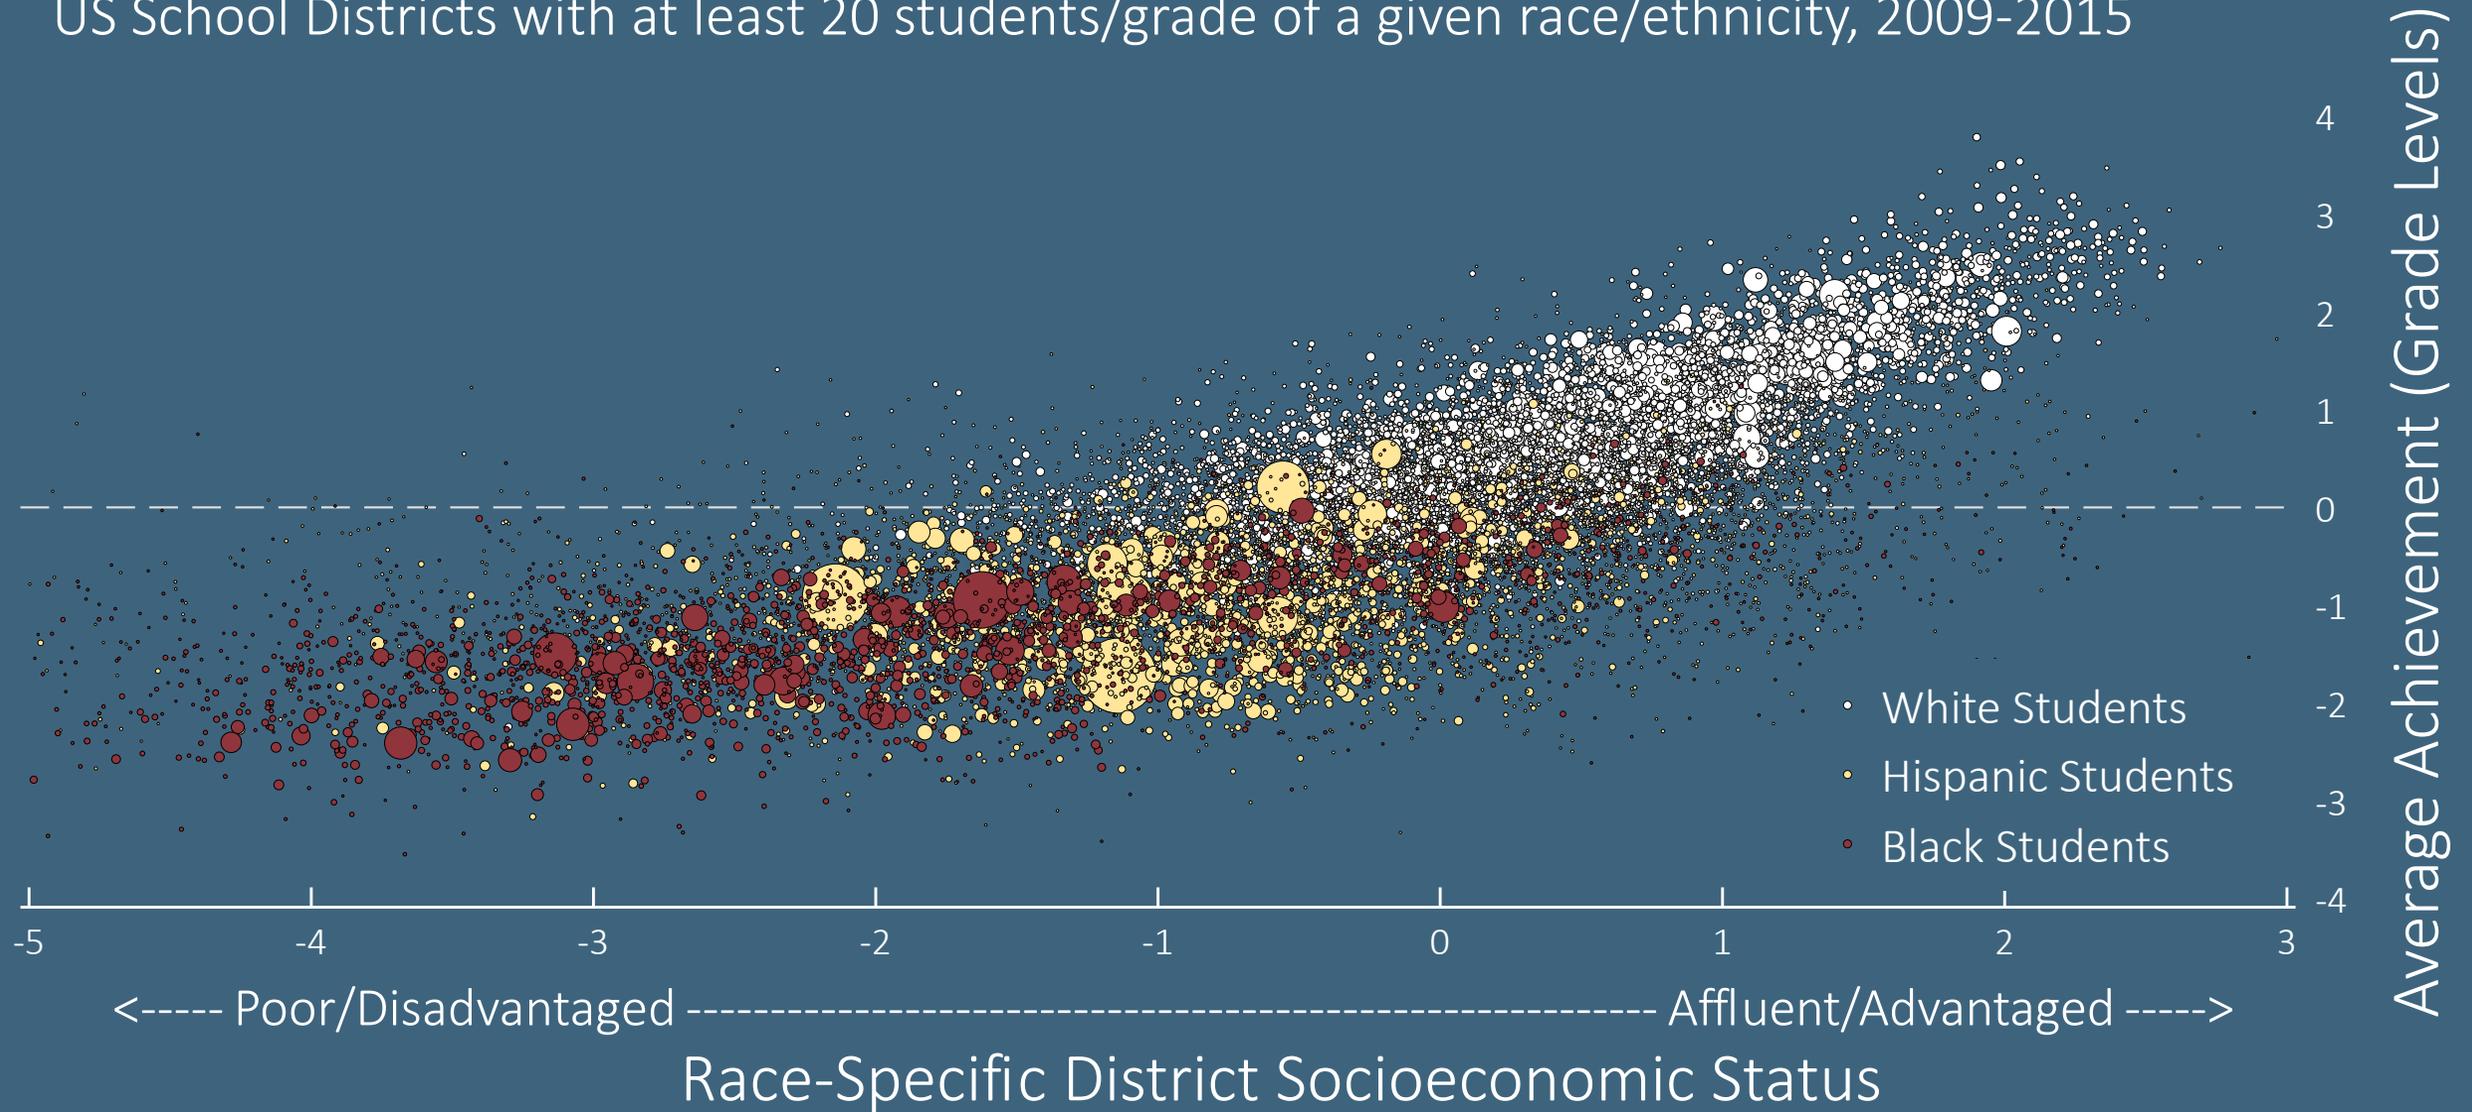

# Academic Achievement and Socioeconomic Status, by Poverty Status

US School Districts, 2009-2015

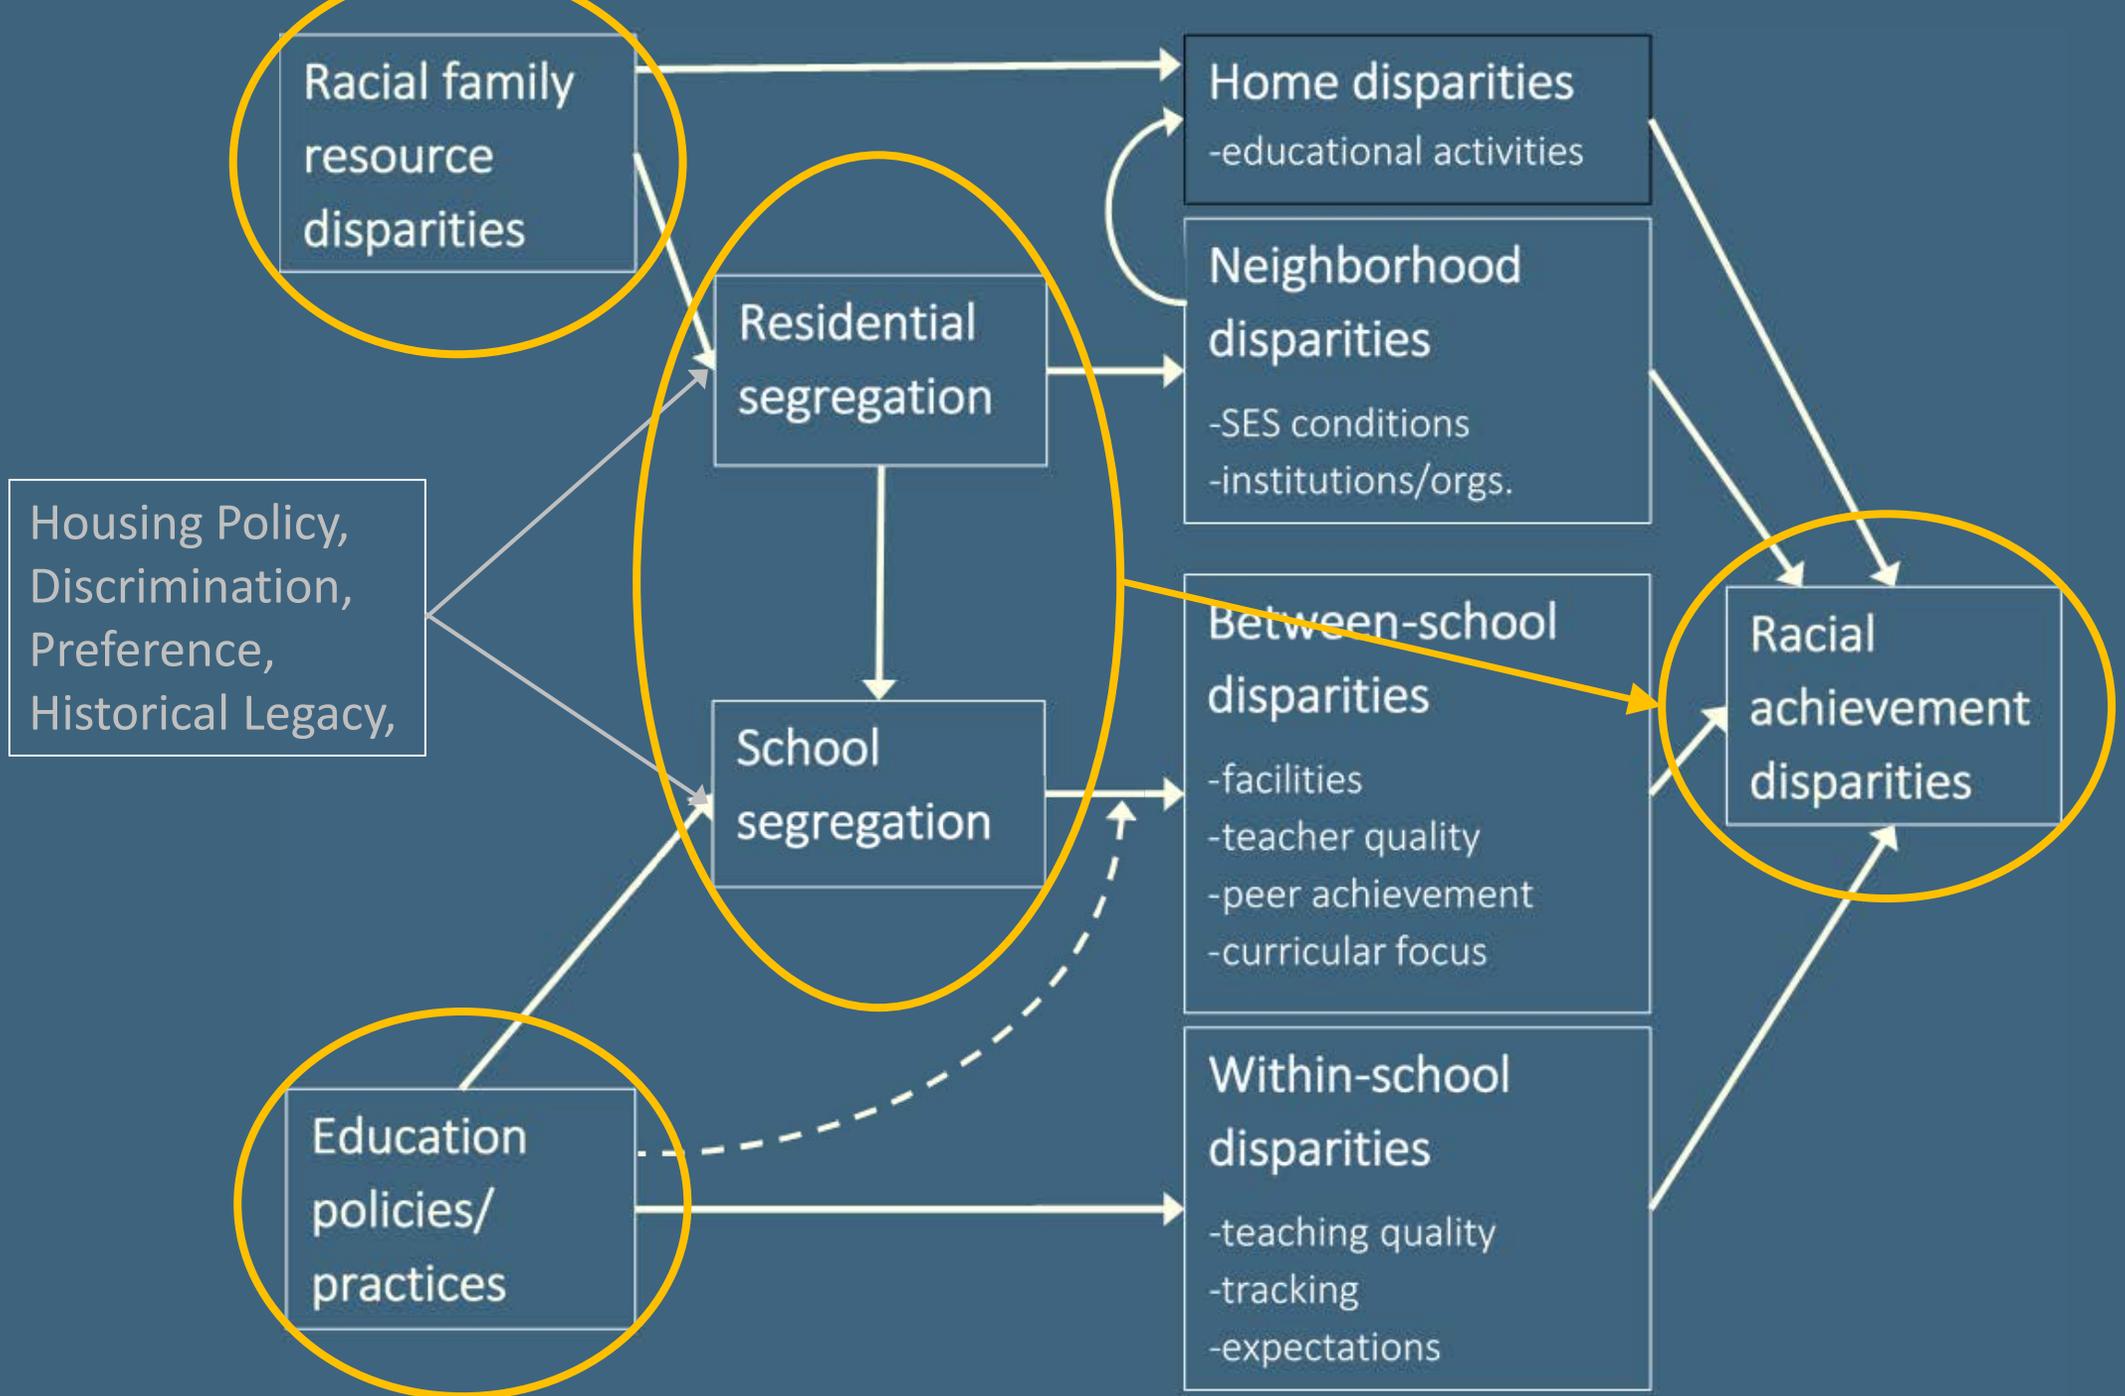

# Academic Achievement and Socioeconomic Status, by Race/Ethnicity

US School Districts with at least 20 students/grade of a given race/ethnicity, 2009-2015

# Does segregation matter?

- This is another way of asking whether neighborhoods and schools affect children's opportunities
- If so, how?

# Which dimension(s) of segregation are related to achievement gaps?

- Residential vs School Segregation
  - Are schools or neighborhoods the more important context?
- Between-School/Neighborhood vs Between-District
  - Do processes operate at local or larger scale?
- Exposure vs Unevenness
  - Does the composition of minority students' contexts matter *per se*, or the difference in minority and white students' contexts?
- Racial vs Socioeconomic Contexts
  - Which is better proxy for the key processes of segregation?

# Bivariate Correlations Between White-Black Achievement Gap and Various Dimensions of Segregation, 311 Metropolitan Areas, 2009-2012

	School Segregation		Residential Segregation

# School poverty and academic performance

- The racial/ethnic difference in exposure to school poverty is consistently the measure of segregation most strongly correlated with achievement gaps
  - This is true in bivariate models and multivariate models
  - And is true of changes in achievement gaps as well
- Coefficients are large:
  - they imply that segregation is independently associated with 15-20% of racial achievement gaps
- Imply that school poverty is associated with achievement: a 20% difference in the proportion of poor classmates is associated with a
  - 0.11-0.18 SD difference in achievement (in ~6<sup>th</sup> grade)
  - 0.009-0.014 SD difference in annual achievement growth (during 3-8<sup>th</sup> grades)

# School poverty and academic performance

- BUT these analyses do not identify segregation mechanisms
- They indicate that school poverty is the best proxy for, or is most proximal to, the operative mechanisms of segregation
- Other forms of segregation (residential, racial, between-district) may operate through differential exposure to school poverty
- These results do not imply “peer effects” (though they might): High-poverty schools may be lower-quality for many reasons:
  - hard to attract most skilled teachers;
  - less parental social/political capital,
  - lower peer achievement may affect curriculum/instruction, etc.)
